

Approach Sheet

Task 1.1-

Load all the data in power query editor one by one, Select data in power query editor then go to remove rows and click on remove duplicate. Do this with all three sheets.

Task 1.2 and 1.3-

In power query editor right click on the column name like for example right click on date and then change type then change the type to date for the specific date column

Do the same process for columns like share comment clicks impressions reach and change the type to whole numbers.

In engagement summary sheet use same process to standardize that week start date and change the engagement rate to percentage.

Using the same procedure load the campaign meta data empower query editor and change the start date and end date change the type to dates and change the ad spend and impression to numbers and engagement uplift into percentage.

Task 1.4-

Load the post sheet to the power query editor and select the hashtag column click on split columns, select split by delimiter, in enter delimiter select space as delimiter.

Task 2.1

Create a new column named engagement rate and use formula = (likes + shares+ comments) / impressions, by double clicking on the small plus icon you will get engagement rate for whole column, then select all data in engagement rate column and change the format from general to percentage.

Task 2.2

Now copy the hold data from to a new sheet label the sheet as engagement analysis, add filter to engagement rate and sorted by top 10.

Task 2.3

Now in this new sheet engagement analysis click on the cell below the top ten results we got, and go to insert and insert a period table from table or range select the range that is whole data from post sheet, now drag content type and platform to rows and drag like shares and comments in values.

To calculate average clicks for post by hashtags select the whole data from post sheet load this data into power query editor select the column named hashtag 1 and hashtag 2,go to transform and select unpivot columns, close and load is data into new sheet name this sheet as hashtag, delete the attribute column, now go to the engagement analysis sheet select a cell and insert pivot table, select from table and range, select the whole range from the hashtag sheet, drag hashtag to row and clicks to values, change the value field settings of click from sum to average.

Task 2.4

To identify the highest performance hashtags , create a new pivot table, drag hashtags to rows , now in pivottable analyze select field items and sets select calculated fields name it as engagement, in formula tab do =likes+shares+comments ,you will get sum of engagement per hashtag now use top 10 filter on this table and change value from 10 to 5 you will get top 5 hashtag.

Task 3.1

To identify platforms with the highest engagement , create a new sheet and name it as platform analysis in this sheet select one cell and select insert pivot table , select table /range, in range select posts dataset , now drag platforms to row and now to calculate engagement go to pivottable analyze, select field, items and sets , then select calculated fields, in formula tab write = likes+comments+shares , this will give you sum of engagement as column in pivot table , Right click on any value of sum of engagement column then select sort from largest to smallest you will get highest engagement among all platform.

Task 3.2

To compare the follower growth rate across platforms You need to create a column name growth rate in the engagement summary sheet to calculate this growth rate use formula = (new follower - unfollow)/total followers, now change the type of growth rate from general to percentage ,we need to create a pivot table, click on cell in platform analysis sheet, go insert and select the option pivot table, select from table/range, select dataset from engagement summary sheet, drag platform to Rows and growth rate to values, then right click on any value of follower growth and select sort from largest to smallest.

Task 3.3

Now to visualize engagement vs ad spend for platform, we have to create a custom table three columns that is platform ,engagement and ad spend .As engagement is calculated before we can copy paste platforms and engagement values to this table, now to have ad spend per platform we have to create pivot table from engagement summary sheet, drag platform into rows and ad spend into values , copy the ad spend values from this to your table and paste it in our custom table. Select the engagement and ad spend values, go to insert and select scatter plot chart.

Task 4.1

To identify the most frequently used Apple hashtags we have to create a pivot table, for this select whole data from hashtags and go to insert create pivot table and select new sheet ,drag hashtags to rows and hashtag to values, it will give you the count of hashtag, now to sort this right click on any values in count of hashtag column and Sort from largest to smallest, Name this sheet as Content Strategy.

Task 4.2

To compare average performance of the post containing each hashtag we have to calculate performance of each post, go to the hashtag sheet and add new column name click through rate and performance, to calculate click through rate use formula = clicks /impression, now to calculate performance use formula= (growth rate + click through rate)*100, now insert a pivot table on content strategy sheet select from table / range and select table from hashtags ,drag hashtags to rows and performance to values and sort the performance from highest to lowest

Task 4.3

Now to compare content performance we have to calculate click through rate and performance similarly as hashtags , now on the content strategy sheet you create a pivot table and select table or range select table from post sheet, drag content types and objectives to rows and performance to values.

Task 4.4

To compare content type performance create a period table on the content strategy sheet, use from table or range, select whole range from posts drag platform and content type to rows and performance to values

Task 5.1.1

Click on any from the post sheet click on the insert with the table the range will be automatically selected, and paste the table to the new sheet name the sheet as campaign effectiveness, then drag campaign to Rows and in values drag impressions likes and clicks, now drag impressions likes and clicks again in values, but this time go to value field settings and change the sum to average

Task 5.1.2

To calculate engagement uplift from the campaign meta data sheet we have to copy the campaign name ,start date and end date, now insert a new column name campaign duration, use formula = (enddate - startdate) +1 , to get campaign duration, now create new column name it as before date, now use formula = start date -campaign days to get before date , Now we have to calculate engagement during and engagement before for this data create a new column name it as engagement during and using sumifs function add likes shares and comments from post data set setting the criteria range between start date and end date. Similarly for engagement before use sumifs function just set duration between before date and start date. Now add a new column name it as daily engagement during use formula = engagement during/campaign days , similarly add a column name as daily engagement before and use formula = engagement before/campaign days, now add a new column name it as engagement uplift use formula = (daily engagement during - daily engagement before)/ daily engagement during

Task 5.2.1

To get the campaign with the highest roi we post have to create a period table and use calculated fields to calculate engagement of every campaign, insert a private table in the campaign effectiveness sheet, select the range from post dataset , drag campaign to rows and engagement to values. Now just copy paste the campaign name and ad spend from campaign metadata and also copy the value of engagement be calculated, now add column named roi and use formula engagement/ad spend

Task5.2.2

How to find which campaign drove the strongest follower growth we first have to calculate follower growth per campaign , in campaign metal data sheet add a column name as follower gain use sumifs to calculate follower growth between start date and end date , now copy the campaign name and follower gain from this sheet and paste as values two campaign effectiveness sheet using sort filter find campaign name the drove the highest follower

Task 6.1

Click anywhere in the engagement summary sheet ,click on insert with table the range will be automatically selected and click on new sheet name this new sheet as follower retention drag platform to columns and week start date to rows and follower gain in values , now click on any date right click and select grouping group the data by year and days, now select pivot chart and select a line chart

Task6.2

Analyze the chart and write down the week with highest follower growth

Task 6.3

Now copy paste the pivot chart right click on any data series click on add trend line change values to moving average change the moving average value to 3 now change the original line to no line and format trend line from dotted line to solid line repeat this process for all data series

Task 6.4

Copy and spend column and follower gain column from engagement summary sheet, and paste them into new sheet name the sheet as correlation, select data from the sheet and insert a scatter plot chart
